

PostCap_SplitPayment — Code-Level View (C4)

OBJECTS TOUCHED (3 DBs · three-part names · no linked servers)

CA_Extensions

execution context (USE CA_Extensions, L1)

CLM_SP_VariableValues

READ config — L57

SplitDelimitedString()

TVF call — L65

SQLDEV_CAP_ERRORS

INSERT on error — L194

plandata_parallel

three-part refs (COTS QNXT schema)

Payment

READ L97 · INSERT L167 · UPD L150

CapVoucher

READ L97/L102 · UPDATE L176

PayCheck

UPDATE paymentid — L181

CapAdjustment

UPDATE paymentid — L187

Affiliation

READ DIRECT affil — L125

QCSIDB

ID sequence service (idtype=4)

IDSequence

READ HOLDLOCK L161 · UPD via sp

spQ_IDSeq 4,1

EXEC — increments id — L162

Temp objects: @TBL (config), #PaymentIDsTBL, #PaymentTBL (TRUNCATE-reloaded per outer iter)

1 · BEGIN TRY (L34) — wraps entire body

2 · Load config (L57–65)
SELECT @STR FROM CLM_SP_VariableValues WHERE SpName=OBJECT_NAME(@@PROCID)

3 · Parse + assign 13 vars (L67–91)
@Fund1–@Fund6, @Method, @Wk1Desc–@Wk6Desc (WHILE loop, nested IF)

4 · Build #PaymentIDsTBL (L93–110)
SELECT DISTINCT PaymentID Payment p ▯ CapVoucher cv
WHERE PayType='CAP' AND Status='OPEN' AND cv.Method=@Method
AND FundID IN(@Fund1–3) AND EXISTS(FundID IN @Fund4–6)

OUTER LOOP — for each PaymentID (L147–192)

4a · ADJUSTMENT check + DIRECT affil lookup (L118–133)
IF EXISTS(CapVoucher CapType='ADJUSTMENT') →
SELECT @NewPayToAffillID FROM Affiliation WHERE affiltype='DIRECT'
reads CapVoucher + Affiliation

4b · TRUNCATE #PaymentTBL + reload from CapVoucher (L134–152)
GROUP BY PaymentID,Program,Provider... ORDER BY Description
! F-3: TRUNCATE runs every outer iteration (rebuild per PaymentID)

INNER LOOP — for each fund/record (L157–188)

branch on @InnerLoop

IF @InnerLoop = 1 (L150–159)
first record: =1
UPDATE Payment SET
amountpaid=@TotalPaid,
checkprintby, checkamt=''
IF @@ROWCOUNT=0 → alt UPDATE
(F-5: cursor-like fallback)

IF @InnerLoop > 1 (L174–188)
generate new PaymentID + split >1
i. SELECT IDSequence WITH(HOLDLOCK) L161
EXEC spQ_IDSeq 4,1 L162
ii. INSERT INTO Payment (...) L167
Status=OPEN(F1–3)/WITHHOLD(F4–6) L171
iii.UPDATE CapVoucher SET paymentid L176
iv. UPDATE PayCheck SET PaymentID L181
v. UPDATE CapAdjustment (if affil) L187
! F-1 (HIGH): 1 INSERT + 4 UPDATES
NO BEGIN TRAN / COMMIT / ROLLBACK.
Partial failure → Payment committed,
CapVoucher/PayCheck/CapAdj orphaned.

↑ SET @InnerLoop += 1 → loop (L189)

SET @InnerLoop=1 ; SET @OuterLoopNum += 1 → loop (L190–191)

5 · BEGIN CATCH (L193–196)
INSERT INTO SQLDEV_CAP_ERRORS (CAPType,ErrorNumber,ErrorProcedure,...)
! F-2 (HIGH): logs only — NO ROLLBACK, NO RAISERROR/THROW.
Parent orchestration sees SUCCESS despite captured error (silent failure).

FINDINGS (review-sourced — mint before issue)

F-1

HIGH

Non-atomic multi-table write
INSERT Payment + 4 UPDATES (CapVoucher, PayCheck, CapAdjustment) run with no explicit transaction. Any UPDATE failing after the INSERT commits leaves reconciliation orphaned. L161–191.

F-2

HIGH

Error swallowed, not propagated
CATCH logs to SQLDEV_CAP_ERRORS only — no ROLLBACK, no THROW/RAISERROR. Proc exits SUCCESS; parent job never learns it failed. L193–196.

F-3

MED

TRUNCATE inside outer loop
#PaymentTBL truncated + rebuilt every PaymentID iteration; page-dealloc I/O per loop. L134.

OPEN QUESTIONS (SME / DBA gate)

U

Recovery SOP if INSERT succeeds but a UPDATE fails? Owner of manual reconciliation? [CRITICAL]

U

WITHHOLD on funds 4–6 — intentional phased hold, or defect? What flips WITHHOLD → OPEN?

U

@NewPayToAffillID NULL when no DIRECT affiliation — proceed with NULL PayToAffillID or error?

U

Typical qualifying PaymentIDs per cap run (outer-loop volume → F-3 impact)?

SCOPE / GROUNDING

- Static single-file review; runtime plane not observed (register rule: runtime overrides code on conflict).
- 3 DBs via three-part names; 0 linked servers in this proc.
- Run cadence: once per capitation run (post-cap), not daily — header L10.
- Config lives in CLM_SP_VariableValues (6 funds, 1 method, 6 week descriptors).
